Summary

- **Introduction**
- **Libre allows Development.**
- **Libre allows to mutualize.**
- **Libre allows safety and quality.**
- **Libre demands Public Services.**
- **Spread libre.**

Introducing

Observations

- **Economy is necessary to know society's movements.**
- **Society's movements are also the internet. So establishing an IT strategy requires knowing the economy.**
- **To establish any strategy, it is important to know physical economy.**

Libres Licenses and Public Domain.

- **Libre licenses are a public domain's extension to copyright.**
- **The public domain is the republic, the "res publica", translated as public thing.**
- **Public domain and libre make it possible to create republics by the dissemination of information thanks to a public currency, something that must also be public.**

Public productive currency.

- **A currency not used does not act on economy.**
- **However, a currency makes it possible to associate, if its use respects growth.**
- **A currency is said to be productive if it is used to help farming growth through industries with the help of services. The only way for industries to be productive is if it belongs to a nation-state, so that it is public. A nation-state brings together inhabitants who want to move towards a common goal.**

Economy and then the Libre.

- **Our society only links elements together.**
- **Economics is understanding society's movements to improve them.**
- **Libre spread makes it possible to increase information's movement at light's speed thanks to computers and the internet.**

Descartes then Colbert, Hamilton.

- **Descartes' dualism was born to analyze emotions. We were discovering emotions at this moment.**
- **Descartes' dualism makes it possible to understand certain emotions in different ways depending on the dualities.**
- **Then, Colbert restored cathedral movement imprisoning traffickers, which made it possible to cancel private state's debts. Then he protected factories from English empire. Then he started with major road works.**
- **This led to a movement of ideas by created bourgeoisie, which were partitioned by dualism, used by the enlightenment movement of the new French financiers. Old Egypt, Alexander Hamilton or China created a public productive currency.**

Partnering for economy

- **While searching for truth, we associate hypotheses with dialogue. The hypotheses' simplicity makes it possible to provoke a reaction initiating us to appropriate a new hypothesis, which, if we do not accept it completely, coming from another, will create a superior hypothesis in us, a superior hypothesis covering a set of hypotheses.**
- **This is the Plato's scientific reflection.**

Two known propagating licenses

- **The GNU GPL license is a worldwide license allowing to protect and disseminate a libre environment leading to redistribute freely.**
- **Then the environment under GNU GPL license allows competition, because anyone can appropriate this environment.**
- **The GNU-Linux Libre environment can then become perfect thanks to the tracking and sharing of old sources.**
- **The Creative Common by SA license is an adaptation of the GNU GPL to the works, asking to cite an entity or someone in order to propagate the author and the work to modify and to redistribute easily.**

Libre allows growth.

Services do not produce

- **It is agriculture and industry that produce.**
- **Services, which were not included in GDP before 1973, must not be too numerous.**
- **Indeed, the short term of private money allows you to create services.**
- **Libre software makes it possible to distribute information services with computers, in order to prevent the trading defined by Plato.**
- **The GNU GPL license or less well LGPL are the best protections against the unnecessary duplication of third-party services. They promote industries better.**

Commercial competition and traffic

- **Commercial competition requires a company to lower prices.**
- **But the trader wants to raise prices.**
- **So a trader alone on a market will raise prices to create traffic.**
- **Libre licenses can intervene to create competition. The GNU GPL or LGPL licenses morally or contractually oblige to disseminate software competition, preventing the software's precariousness, spike of software traffic.**

China has used public domain

- **The public domain and the public thing have allowed China to grow very quickly.**
- **Industries could use freely every shared processes.**
- **Free grows industries through sharing and dissemination with a free nation-state, thanks to a public currency.**
- **The GNU GPL license should allow China to avoid software redundancies that create unnecessary jobs and money, in order to grow the world.**

Libre Software helps Industries

- **Libre allows Industries to adapt any work to its needs.**
- **Thus agriculture and industry are helped.**
- **Then country's people obtains better products thanks to trains, making it possible to save energy, to broadcast locally saving labor.**
- **Saving labor creates a goods's growth. The license makes it possible to protect this worldwide distribution with contracts.**

Libre allows to mutualize..

Mutualization

- **Pooling makes it possible to share insufficiently used resources.**
- **Pooling combines makes it possible to make them profitable.**
- **You can also share a fiber subscription in a building.**
- **Thus, pooling allows ecology and time so money saving.**
- **The GNU licenses make it possible to disseminate the mutualizations.**

Libre's mutualization

- **Africa responded to precariousness with pooling.**
- **Libre is a kind of mutualization diffusing at light's speed thanks to computers and Internet.**
- **Free software is useful while growing, but it is also useful with precariousness.**
- **So Africa deals with countries using public money.**
- **The GPL license will allow countries to find new shares in order to save work to create.**

Privater software impoverishes.

- **The private sector creates software publishers who do the same thing.**
- **Then the community becomes poorer buying software that cannot really be tested, because it is hidden.**
- **The software can even be abandoned or not working, which can be avoided with the libre one.**
- **So the collectivity takes care of libre. The GPL license allows them by contract to continue sharing with private companies.**

What is a foundation ?

- **A foundation is a companies' group improving a libre software or tool.**
- **Then the libre work is free for anyone thanks to sharing.**
- **Then the other countries translate the foundation's work.**
- **The foundation sells its services to grow countries. Countries then participate in the foundation, all the more so with GNU LINUX, encouraging sharing which has been beneficial to countries.**

**Libre allows
safety and
quality.**

Privater culmination

- **Privater culmination are rob, censorship, monopoly and planned obsolescence.**
- **Indeed, privater makes it possible to hide the power.**
- **Libre allows the little ones to see how any tool works in order to protect themselves.**
- **The GNU GPL license instituted as a public thing allows the country to reverse these traffics' trend, also nationalizing companies that have become illegal by theft or trafficking.**

Can we have internet with privater ?

- **If our community does not know the environment we are using, knowing that computing is information, the information can be modified (Windows) or redirected (MAC OS), on private or an insecure language.**
- **Privater defined with French language is property therefore of economy, education therefore of the know-how, law therefore of philosophy, computer science therefore of information and journalism. There is a need to philosophize and learn journalism.**
- **But privative makes it possible to emancipate oneself if we are a citizen thanks to the fixed-rate loan payable. At that moment, we are part of a group called the trade union council.**
- **The private sector therefore allows those who have enriched themselves materially to continue to own easily during recession.**

Inside privative, there are monopolies

- **The privative grows negatively for the monopoly while getting a currency.**
- **It is education, therefore history, philosophizing, therefore dialog and meditating on its limits, computer journalism on the limits of the human, which permits to go against a monopoly.**
- **We will then verify its information through journalism and adapt it to fundamental rights, philosophizing to publish its policy through journalism, analyzed by the monopoly.**
- **We may request to have a private life with consumer associations and net neutrality.**
- **Getting a public currency makes it possible to undo the privative according to the anti-trust law and the jubilee economy.**

GNU-Linux is the safe environment

- **Free nation-states using public money permit to create the safest free environment there is.**
- **Now our states are corrupted by finance.**
- **So they create backdoors.**
- **But these backdoors can do less things on GNU-Linux because it would be seen in the sources, which are the media for shared creation.**

Libre environment using GNU GPL

- **A Libre environment under the GNU GPL license allows sharing as example, or even as justice with contracts or institutions.**
- **Then anyone can analyze the Libre and adapt any dependent tool to their needs, to make the tool safe.**
- **Then the tool is better understood, can save other same category's tools, becomes safe thanks to foundations and nation-states.**

The perfect old environment

- **The old Free environment can become perfect if the community takes care of it through issues.**
- **Then the old tools are saved or even adapted to recent versions, or even completely secure.**
- **So the old tools are not thrown into the trash.**
- **It is possible to use your old computer thanks to a GNU-Linux.**

**Libre needs
Public Services.**

Public Services / Public Money

- **The private currency tends to privatize.**
- **Creating a public currency makes it possible to help industries through public services.**
- **Indeed, industries have a long term view, unlike with private money.**
- **Public services then create Libre or public domain.**
- **The GNU GPL license then makes it possible to grow with contracts between other countries with services' competition encouraging industries.**

Centralize with State

- **A state has to protect its free works and its population protecting its information.**
- **The state must create its own public servers for videos, books and ebooks, any type of media, social network, references, in order to protect authors, not more powerful companies.**
- **The compiled languages RAD GNU LGPL and the GNU GPL license allow security, ease and speed to create, maintenance and dissemination.**

Little People and Public Services

- **Public services can defend the little ones through monetary sovereignty.**
- **Indeed, the private sector can censor you, reward you badly, or even steal from you.**
- **So it is necessary to grow public services, possibly those of other countries, to be properly compensated.**
- **So we broadcast freely against exclusivity.**
- **The GNU GPL license allows nation-states to make companies working instituting the need to promote commercial competition, preventing traffic.**

Job and libre

- **Free jobs are slavery.**
- **On the other hand, free and open source software allow a global industrialized countries' growth.**
- **So, allowing access to machine tools by transport, to then make it possible to easily catch up with a free and public part of the industries, can prevent financial empires' creation.**
- **The GNU-GPL license allows a wider dissemination through contracts.**

Broadcast Libre

Disdection of social errors

- **The logical troll consists to change society's mind through information by redefining certain words to create wars.**
- **The solution in this case is to seek your truth with your friends, your best friend, according to Plato. We find our happiness to show our optimism.**
- **When we seek the truth with others, we can detect changes very easily. We find happiness.**

We're paranoid at the beginning

- **Initially we want to protect ourselves.**
- **So we don't want to broadcast to just anyone.**
- **But your work will be found more easily on the Internet if it is libre. It's about knowing the global websites to share libre works in your language, then that of others when you are trolled.**
- **Helping industries by processes including the referenced distribution in free part, makes it possible to protect your textual broadcasts to deepen writings and protected dialogue, your video broadcasts making it possible to publicize and influence when you are public.**
- **The geniuses who want to grow the world end up adopting the GNU GPL or Creative Common by SA licenses in order to allow the perfection by points of view's competition on human's limits.**

Then we know how to broadcast :

- **When his work is saved, to be grown without financial possibility, makes it possible to support a profession, a group of companies.**
- **We then refer to his work on archive.org , framalibre.org , a version manager, dogmazic, musopen, musescore, freescore.**
- **We then write and reference in our field and our community promoting dissemination through the Creative Common by SA license or a GPL license, for works.**
- **The GNU GPL license allows software to be kept as shared software thanks to the GNU community.**

Then we see that sells

- **Sometimes it is the idea that we have found that allows advertising.**
- **For example, an idea helps to attract beginners to use its tool.**
- **So we diffuse his work at the same time while helping his tool by his work half or entirely libre.**
- **The GNU GPL and Creative Commons licenses, with GNU LINUX encourage sharing.**

Sources and diffusing

- **From Henry Charles Carey and his economic science, with the support of a speech analyst as Richard Stallman.**
- **According to Economy for Kids, according to Carey by Matthieu Giroux.**
- **Thanks to Openclipart for resizable images.**
- **Broadcast by archive.org , framalibre.org , Agoravox, Developpez, April.**
